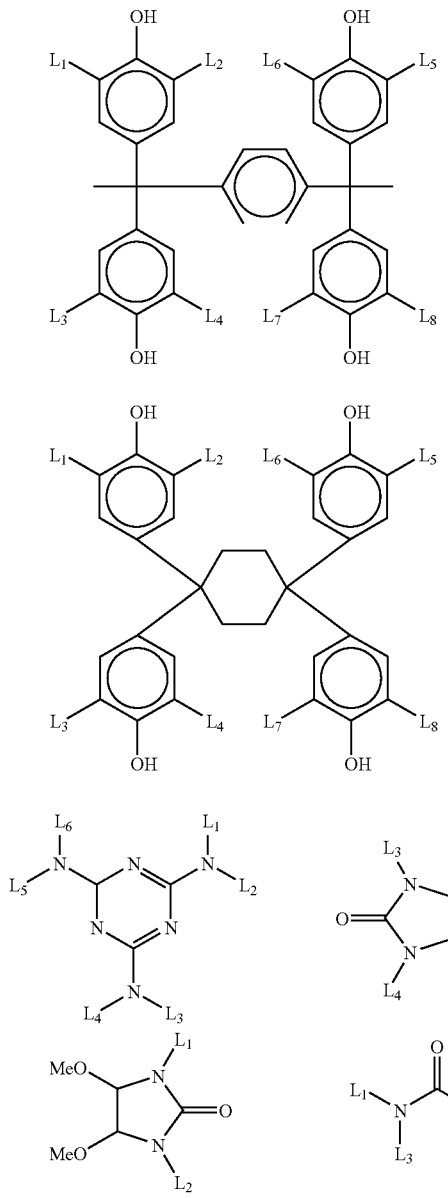
-continued



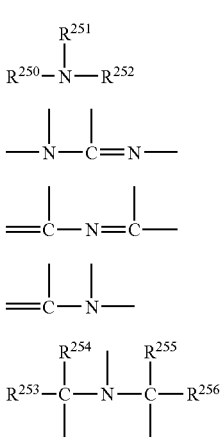
In the above formulae, L_1 to L_8, which may be the same or different, each represents a hydrogen atom, a hydroxymethyl group, a methoxymethyl group, an ethoxymethyl group, or an alkyl group having from 1 to 6 carbon atoms.

Crosslinking agents are used generally in proportion of from 3 to 70 mass % in the solids content of the photosensitive composition, and preferably from 5 to 50 mass %.

Basic Compound (F):

For decreasing the fluctuation of performances due to aging during the period of time from exposure to heating, it is preferred for the photosensitive composition of the invention to contain a basic compound.

As the preferred structures of basic compounds, the structures represented by any of the following formulae (A) to (E) can be exemplified.



In formula (A), R^{250}, R^{251} and R^{252} each represents a hydrogen atom, an alkyl group having from 1 to 20 carbon atoms, a cycloalkyl group having from 3 to 20 carbon atoms, or an aryl group having from 6 to 20 carbon atoms, and R^{250} and R^{251} may be bonded to each other to form a ring. These groups may have a substituent, and as the alkyl group and cycloalkyl group having a substituent, an aminoalkyl group having from 1 to 20 carbon atoms or an aminocycloalkyl group having from 3 to 20 carbon atoms, a hydroxyalkyl group having from 1 to 20 carbon atoms or a hydroxycycloalkyl group having from 3 to 20 carbon atoms are preferred.

These groups may contain an oxygen atom, a sulfur atom or a nitrogen atom in the alkyl chain.

In formula (E), R^{253}, R^{254}, R^{255} and R^{256} each represents an alkyl group having from 1 to 6 carbon atoms, or a cycloalkyl group having from 3 to 6 carbon atoms.

As the preferred examples of basic compounds, guanidine, aminopyrrolidine, pyrazole, pyrazoline, piperazine, aminomorpholine, aminoalkylmorpholine, and piperidine can be exemplified, and these compounds may have a substituent. As more preferred basic compounds, compounds having an imidazole structure, a diazabicyclo structure, an onium hydroxide structure, an onium carboxylate structure, a trialkylamine structure, an aniline structure, or a pyridine structure, alkylamine derivatives having a hydroxyl group and/or an ether bond; and aniline derivatives having a hydroxyl group and/or an ether bond can be exemplified.

As the compounds having an imidazole structure, imidazole, 2,4,5-triphenylimidazole, and benzimidazole can be exemplified. As the compounds having a diazabicyclo structure, 1,4-diazabicyclo[2.2.2]octane, 1,5-diazabicyclo[4.3.0]nona-5-ene, and 1,8-diazabicyclo[5.4.0]undeca-7-ene can be exemplified. As the compounds having an onium hydroxide structure, triarylsulfonium hydroxide, phenacylsulfonium hydroxide, sulfonium hydroxide having a 2-oxoalkyl group, specifically triphenylsulfonium hydroxide, tris(t-butyl-phenyl)sulfonium hydroxide, bis(t-butylphenyl)iodonium hydroxide, phenacylthiophenium hydroxide, and 2-oxopropyl-thiophenium hydroxide can be exemplified. The compounds having an onium carboxylate structure are compounds having an onium hydroxide structure in which the anionic part is carboxylated, e.g., acetate, adamantane-1-carboxylate, and perfluoroalkyl carboxylate are exemplified. As the compounds having a trialkylamine structure, tri(n-butyl) amine and tri(n-octyl)amine can be exemplified. As the aniline compounds, 2,6-diisopropylaniline and N,N-dim-
