The bubbles of nothing considered here affect many otherwise stable flux vacua. One should consider this instability as a new decay channel whose end result is a type of terminal vacuum, a vacuum without a classical spacetime. This is clearly relevant for any program undertaking the assigning of probabilities to different vacua in the landscape, the so-called measure problem. (See for example, [23] and references therein.)

VI. ACKNOWLEDGMENTS

We would like to thank Jaume Garriga, Oriol Pujolas and Alex Vilenkin for very helpful conversations and discussions. J.J.B.-P. would like to thank the Theory Division at CERN for its hospitality and support in the early stages of this work. J.J.B.-P. is supported in part by the National Science Foundation under grant 06533561. B.S. is supported in part by Foundational Questions Institute grant RFP2-08-26A.
