

9. The **Set date and time** window for initializing the time opens. Select one of the following three items to initialize the time:

- **Use the configured External Time source to set date and time:** You can set ETS during the initializing time process.
- **Set date and time:** Select this option when you set the date and time for CTS manually.
- **Modify time by delta to set date and time:** Select this option when you set the current TOD of CTS for initializing the time and specify a delta from the TOD.

We select **Use the configured External Time source to set date and time**, and click **NEXT** to continue (Figure 8-37).

Note: Selecting **Use the configured External Time source to set date and time** enables accurate setting of the initial time, so generally use this option.
