- ²⁸ We have compared the band structures obtained using the rigid band model and virtual crystal (VC) approximation. Within an energy window of 3 eV around the Fermi energy the electronic bands are identical (with maximum deviation up to 40 meV). Beyond this energy range deviations up to 200 meV were observed. These differences should not visibly effect the results. Larger differences between rigid band model and VCA were observed by P. Larson and S. Satpathy, Phys. Rev. B **79**, 054502 (2009). Obviously, a calculation of χ_0 within a supercell approach is computationally intractable.
