

change in magnetic field due to its particular ground state. Consequently, an infinitesimally small magnetic field is enough to polarize the residual spin-a-half in the dot, which definitely hinders a full restoration of the underscreened Kondo effect by tuning the magnetic field.

### Acknowledgments

We acknowledge fruitful discussions with J. von Delft and R. Žitko. The authors acknowledge support from

the Alexander von Humboldt Foundation. I.W. acknowledges support from the Foundation for Polish Science and funds of the Polish Ministry of Science and Higher Education as research projects for years 2006-2009 and 2008-2010. Financial support by the Excellence Cluster "Nanosystems Initiative Munich (NIM)" is gratefully acknowledged. L.B. acknowledges the support from Hungarian Grants OTKA through projects K73361 and NNF78842.
