### 3. Verify that the AIX LPAR is ready to be moved.

- a. For this example, only a single AIX VM is needed. The VM that is moved in this case is rt11006. For this reason, unmanage all VMs except the one to be moved by running the following commands:

```

ksysmgr unmanage vm rt11007
ksysmgr unmanage vm rt11008
ksysmgr unmanage vm rt11009
...

```

- b. To verify that the environment is ready, run a **ksysmgr** discovery and verification process:

```

root:ksys7003rb.aus.stglabs.ibm.com: / >
# ksysmgr discover site sitert11 verify=yes
Host_group Default_HG was modified
Running discovery on entire site, this may take few minutes...
    Storage state synchronization has started for Host_group Default_HG
    Storage state synchronization has completed for Host_group
Default_HG
    Discovery has started for VM rt11006
    Configuration information retrieval started for VM rt11006
    Configuration information retrieval completed for VM rt11006
Discovery has finished for sitert11
1 out of 1 managed VMs have been successfully discovered

```

```

Site verification started for sitert11
    Default_HG verification has started
    rt12-8286-42A-2100E5W verification has started
    rt11006 verification has started
    rt11006 verification has completed
    Default_HG verification has completed
Verification has finished for sitert11
1 out of 1 VMs have been successfully verified

```

Lastly, the VM is checked and shown to be **READY\_TO\_MOVE**:

```

root:ksys7003rb.aus.stglabs.ibm.com: / >
# ksysmgr q vm rt11006
VM:
Name:          rt11006
UUID:          793E27BD-0113-4A26-93FE-F8DDD5D9B3F1
Host:          rt11-8286-42A-0607585
State:         READY_TO_MOVE
Priority:       Medium
skip_resource_check: No

```
