## 7.4.5 mysqldump Tips

This section surveys techniques that enable you to use mysqldump to solve specific problems:

- · How to make a copy a database
- · How to copy a database from one server to another
- How to dump stored programs (stored procedures and functions, triggers, and events)
- · How to dump definitions and data separately

## 7.4.5.1 Making a Copy of a Database

```
shell> mysqldump db1 > dump.sql
shell> mysqladmin create db2
shell> mysql db2 < dump.sql</pre>
```

Do not use --databases on the mysqldump command line because that causes USE db1 to be included in the dump file, which overrides the effect of naming db2 on the mysql command line.

## 7.4.5.2 Copy a Database from one Server to Another

On Server 1:

```
shell> mysqldump --databases db1 > dump.sql
```

Copy the dump file from Server 1 to Server 2.

On Server 2:

```
shell> mysql < dump.sql
```

Use of --databases with the mysqldump command line causes the dump file to include CREATE DATABASE and USE statements that create the database if it does exist and make it the default database for the reloaded data.

Alternatively, you can omit --databases from the mysqldump command. Then you need to create the database on Server 2 (if necessary) and specify it as the default database when you reload the dump file.

On Server 1:

```
shell> mysqldump db1 > dump.sql
```

On Server 2:

```
shell> mysqladmin create db1
shell> mysql db1 < dump.sql
```

You can specify a different database name in this case, so omitting --databases from the mysqldump command enables you to dump data from one database and load it into another.

## 7.4.5.3 Dumping Stored Programs

Several options control how mysqldump handles stored programs (stored procedures and functions, triggers, and events):

- --events: Dump Event Scheduler events
- --routines: Dump stored procedures and functions
