Another server status variable Ndb_conflict_fn_max provides a count of the number of times that a row was not applied on the current SQL node due to "greatest timestamp wins" conflict resolution since the last time that mysqld was started.

The number of times that a row was not applied as the result of "same timestamp wins" conflict resolution on a given <code>mysqld</code> since the last time it was restarted is given by the global status variable <code>Ndb_conflict_fn_old</code>. In addition to incrementing <code>Ndb_conflict_fn_old</code>, the primary key of the row that was not used is inserted into an *exceptions table*, as explained elsewhere in this section.

See also NDB Cluster Status Variables.

Examples

The following examples assume that you have already a working NDB Cluster replication setup, as described in Section 23.6.5, "Preparing the NDB Cluster for Replication", and Section 23.6.6, "Starting NDB Cluster Replication (Single Replication Channel)".

NDB\$MAX() example. Suppose you wish to enable "greatest timestamp wins" conflict resolution on table test.t1, using column mycol as the "timestamp". This can be done using the following steps:

- 1. Make sure that you have started the source mysqld with --ndb-log-update-as-write=OFF.
- 2. On the source, perform this INSERT statement:

```
INSERT INTO mysql.ndb_replication
   VALUES ('test', 't1', 0, NULL, 'NDB$MAX(mycol)');
```

Inserting a 0 into the server_id indicates that all SQL nodes accessing this table should use conflict resolution. If you want to use conflict resolution on a specific mysqld only, use the actual server ID.

Inserting NULL into the binlog_type column has the same effect as inserting 0 (NBT_DEFAULT); the server default is used.

3. Create the test.t1 table:

Now, when updates are performed on this table, conflict resolution is applied, and the version of the row having the greatest value for mycol is written to the replica.

Note

Other $binlog_type$ options—such as NBT_UPDATED_ONLY_USE_UPDATE should be used to control logging on the source using the $ndb_replication$ table rather than by using command-line options.

NDB\$OLD() example. Suppose an NDB table such as the one defined here is being replicated, and you wish to enable "same timestamp wins" conflict resolution for updates to this table:

```
CREATE TABLE test.t2 (
a INT UNSIGNED NOT NULL,
b CHAR(25) NOT NULL,
columns,
mycol INT UNSIGNED NOT NULL,
columns,
PRIMARY KEY pk (a, b)
```
