► Capacity State: Whether any active data exists on the physical volume and the status of that data in relation to the volume's capacity. This field can be left blank. The following other values are possible:

- – Empty: The volume contains no data and is available for use as a physical scratch volume.
- – Filling: The volume contains valid data, but is not yet full. It is available for more data.
- – Full: The volume contains valid data. At some point, it was marked as full and more data cannot be added to it. In some cases, a volume can be marked full and yet be short of the volume capacity limit.

► Home Pool: The pool number (0 - 32) to which the physical volume was assigned when it was inserted into the library, or the pool to which it was moved through the library manager Move/Eject Stacked Volumes function. This field can be left blank.

► Current Pool: The number of the storage pool (0 - 32) in which the physical volume currently exists. This field can be left blank.

► Encryption Key: The EK label that is designated when the volume was encrypted. This field is a text field. The following values are valid:

- – A name that is identical to the first or second key label on a physical volume.
- – Any physical volume that was encrypted by using the designated key label is included in the search.
- – Search for the default key. Select this option to search for all physical volumes that were encrypted by using the default key label.

► Pending Eject: Whether to include physical volumes pending an eject in the search query. The following values are valid:

- – All Ejects: All physical volumes pending eject are included in the search.
- – Priority Ejects: Only physical volumes that are classified as priority eject are included in the search.
- – Deferred Ejects: Only physical volumes that are classified as deferred eject are included in the search.

► Pending Move to Pool: Whether to include physical volumes pending a move in the search query. The following values are possible:

- – All Moves: All physical volumes pending a move are included in the search.
- – Priority Moves: Only physical volumes that are classified as priority move are included in the search.
- – Deferred Moves: Only physical volumes that are classified as deferred move are included in the search.

  Any of the previous values can be modified by using the adjacent menu. Use the adjacent menu to narrow the search down to a specific pool set to receive physical volumes. The following values are possible:

  - All Pools: All pools are included in the search.
  - 0 - 32: The number of the pool to which the selected physical volumes are moved.
